## **Listing of Claims:**

## 1-2 (Canceled)

3. (Previously Presented) A computer implemented method for regulating data consumption in a wireless network, comprising the steps of:

storing an account for each of a plurality of subscribers of the wireless network, each account having an upstream and a downstream balance that tracks a wireless network data consumption of the respective subscriber of the wireless network;

imposing a bandwidth limitation on a subscriber of the wireless network responsive to either the upstream or downstream balance of the account of that subscriber of the wireless network dropping below a defined level; and

for each account, crediting the balance of the respective account on an intermittent basis.

- 4. (Original) The method of claim 3, wherein the step of imposing the bandwidth limitation includes causing an existing bandwidth limitation to be more restrictive.
- 5. (Original) The method of claim 3, wherein the step of crediting is performed on a periodic basis.
- 6. (Original) The method of claim 3, wherein the step of crediting includes crediting the balance of each account by an amount that depends upon the balance of the respective account.
- 7. (Original) The method of claim 3, further including a step of reducing a bandwidth limitation on one of the subscribers responsive to the balance of the account of that subscriber rising above a predetermined level.
- 8. (Original) The method of claim 7, wherein the step of reducing includes releasing the bandwidth limitation.

- 9. (Original) The method of claim 3, further including a step of, for each of the subscribers, reducing the balance of the account of the respective subscriber by an amount based upon a volume of network data consumption by that subscriber.
- 10. (Original) The method of claim 3, further including a step of sending information to each of the subscribers indicating the balance of the account of each respective subscriber.
- 11. (Previously Presented) The method of claim 3, wherein the upstream and downstream balance for each account is presented to the user.

## 12 (Canceled)

- 13. (Original) The method of claim 3, wherein the balance for each account is a burst balance.
- 14. (Original) The method of claim 3, wherein imposing the bandwidth limitation includes imposing the bandwidth limitation on the subscriber responsive to the balance of the account of that subscriber dropping below a defined level and at further depending upon least one of a time of day and a current network congestion level.
- 15. (Previously Presented) The method of claim 3 comprising regulating a bandwidth available to a network subscriber based on whether a predetermined volume of data has previously been consumed by the subscriber.
- 16. (Original) The method of claim 15, wherein the bandwidth is regulated based on whether the predetermined volume of data has been consumed by the subscriber over a defined window of time.
- 17. (Original) The method of claim 15, further including a step of sending information to the subscriber indicating whether the bandwidth is being regulated.

- 18. (Previously Presented) The method of claim 3 wherein the wireless network is configured to regulate a bandwidth available to one of the subscribers based on whether a predetermined volume of data has previously been consumed by that subscriber.
- 19. (Original) The apparatus of claim 18, wherein the apparatus includes a computer coupled to a database, the database storing an account balance for each of the plurality of subscribers, the account balance depending upon a volume of data previously consumed by a respective subscriber.
- 20. (Original) The apparatus of claim 19, wherein the computer is configured to regulate the bandwidth available to one of the subscriber responsive to the account balance of that subscriber dropping below a defined level.
- 21. (Previously Presented) A computer implemented method in a wireless network for regulating data consumption in a network, comprising steps of:

storing an upstream balance and a downstream balance for each of a plurality of subscribers of the wireless network, each balance tracking a different aspect of wireless network data consumption of the respective subscriber;

imposing a bandwidth limitation on a subscriber responsive to at least one of the balances of that subscriber of the wireless network dropping below a defined level; and

for each subscriber of the wireless network, crediting at least one of the balances of the respective subscriber of the wireless network on an intermittent basis.

## 22. (Canceled)

23. (Original) The method of claim 21, wherein the plurality of balances for each subscriber are in a same account of the respective subscriber.
